HP NonStop Code Scan

ITL's Code Scanning tool has been created to alleviate some of the risk and effort when preparing your software for a change in operating system / platform.

Migrating legacy software to a later operating system can be problematic due to the amount of effort required in checking all of your source code for redundant procedure calls, along with the lack of skilled staff and the likelihood of human error due to the monotonous nature of the task.

A re-compilation using later compilers could be high-risk, as not all potential issues will be identified! Therefore, programs can often be left vulnerable to Run-Time Trap errors if they are merely re-compiled.

ITL's Code Scanning tool can scan an entire application for any problems far more quickly than even the most highly trained members of staff, as it will be fast, accurate and operates with no distractions, thereby ensuring that any compliance issues will not be overlooked.

The Code Scanning tool can create reports detailing all potential problems in an application's source code. These reports can then be distributed across a team, helping to accelerate the source code amendments.

The benefits of using ITL's Code Scanning tool as part of your migration exercise, will be reduced costs, reduced effort and reduced risk to the migration of your critical applications.

- Compliance checks for D-Series, G-Series and Itanium Operating Systems
- Scan all (or selected) source code in one pass
- Identify redundant procedure calls
- Reduce costs in time and effort
- Evaluation and full versions available
